### Claims Listing

1. (Currently Amended) An implantable stent comprising:  
a tubular member having an interior surface and an exterior surface,  
at least one of said surfaces being hydrophobic to a body fluid in that the contact angle  
5 between a droplet of said fluid and said at least one surface is greater than 90°, and  
a region of said at least one surface including an array of microstructures or  
nanostructures that covers first portions of said surface, said array causing said region to have a  
dynamically controllable hydrophobicity.
- 10 2. (Original) The stent of claim 1, further including a control device affixed to said  
tubular member for varying said hydrophobicity.
3. (Original) The stent of claim 2, wherein said control device comprises an  
electronic device or an optical device.
- 15 4. (Original) The stent of claim 3, wherein said control device is remotely actuatable  
from an external source.
5. (Original) The stent of claim 1, wherein said array leaves second portions of said  
20 surface exposed, and further including a chemically active substance adhered to at least one of  
said exposed second portions.
6. (Original) The stent of claim 5, wherein said substance comprises a  
pharmacological agent or a drug.
- 25 7. (Original) The stent of claim 6, further including a control device affixed to said  
tubular member, said device being capable of releasing said agent or drug from said at least one  
second portion.

*Arney 10-18-4*  
*Serial No. 10/798,064*

8. (Original) The stent of claim 7, further including  
an electrically conductive substrate that is configured to be electrically isolated from  
body fluid in contact with said array of microstructures or nanostructures, and

5 wherein said control device is capable of applying a voltage between said array and said  
substrate to vary the penetration of the interstices of said array by said fluid, thereby causing  
release of said agent or drug into said fluid.

9. (Currently Amended) The stent of claim 1, wherein said array leaves second  
10 portions of said surface exposed, and further including  
means for electrically isolating said array into laterally separate spatial zones,  
at least two of said zones containing chemically active substances adhered to the exposed  
second portions thereof, and  
wherein said control device is capable of causing the release of said substances of the  
15 separate zones at different times.

10. (Original) The stent of claim 9, wherein said substances are the same chemically  
active substances of the same or a different dose.

20 11. (Original) The stent of claim 9, wherein said substances are different chemically  
active substances.

12. (Original) The stent of claim 1, further including means for altering the shape of  
said stent *in vivo*.

25

13. (Original) The stent of claim 12, wherein said altering means is capable of  
changing the diameter of said tubular member.

14. (Original) The stent of claim 1, wherein said tubular member has an elongated

*Arney 10-18-4  
Serial No. 10/798,064*

slot that is coextensive with its length, thereby forming a pair of elongated edges that are movable relative to one another, and the stent further comprising a plurality of electrically controllable structures thereon, the structures capable of moving said edges and releasably latching said edges.

5

15. (Original) The stent of claim 1, wherein said tubular member comprises a semiconductor substrate and said array of microstructures or nanostructures is disposed on said substrate.

10

16. (Original) The stent of claim 15, wherein said tubular member further comprises a layer disposed on said substrate, said substrate and said layer having different thermal expansion coefficients.

15

17. (Original) The stent of claim 16, wherein said microstructures or nanostructures have at least one dimension that is in the range of 4  $\mu\text{m}$  to 20 nm.

20

18. ((Previously Presented)) An implantable stent comprising a tubular member including a conducting substrate, said member having an interior surface and an exterior surface,  
at least one of said surfaces being hydrophobic to a body fluid in that the contact angle between a droplet of said fluid and said at least one surface is greater than 90°, and  
a region of said at least one surface including an array of pillar-like microstructures or nanostructures that covers first portions of said surface, said array rendering the region to have a dynamically controllable hydrophobicity between a first state, in which said fluid is suspended over the top of said microstructures or nanostructures, and a second state, in which said fluid penetrates the interstices of said microstructures or nanostructures,  
a medicinal substance adhered to an exposed second portion of said surface located in said interstices of said microstructures or nanostructures, and  
a control device affixed to said tubular member for applying a voltage between said fluid

25

*Arney 10-18-4*  
*Serial No. 10/798,064*

and said substrate to vary said hydrophobicity, thereby releasing said substance into said body fluid when in said second state, said device being actuatable from an *ex vivo* source.

19. (Currently Amended) The stent of claim 18, wherein  
5 | said exposed second portion is electrically isolated intoincludes laterally separate first  
and second spatial zones electrically isolated from one another, each zone containing a medicinal  
substance adhered thereto, and  
said control device is capable of causing the separate release of said substances from the  
first and second zones.

10 | 20. (Original) The stent of claim 19, wherein said substances adhered to said first and  
second zones are the same substance of the same or a different dose.

15 | 21. (Original) The stent of claim 19, wherein said substances adhered to said first and  
second zones are different substances.

22-28. (Canceled)
